## ACADEMIC PROJECT:

**Title:** Comparative Analysis of Distance Vector and Link-State Routing Protocol for Organizational Development.

### Description:

Dynamic routing protocols are classified in to two major categories which are Distance Vector and Link-state routing protocols. The early routing protocols were based on distance vectors, where network information is shared with the directly connected neighbouring devices. link-state routing protocol create a complete network topology by gathering information from all of the other connected network devices. Link-state routing protocol determine the best route based on different criteria such as speed, bandwidth and the distance between devices connected to the network. Comparative analyses are carried out on three basic types of dynamic routing protocols like RIP ,OSPF,EIGRP which one is the best amongst the three. In conclusion it was find out that EIGRP is the best dynamic routing protocol.
